

IMPORTANT NOTICE

USE SETUP PROGRAM TO INSTALL

To make the install process easier, Wizard now comes with a SETUP program. To install, put the disk in either floppy drive. Set the default to that drive. Type SETUP and press ENTER. Follow the install instructions. The SETUP program was added at the last hour before publication and does not appear in the documentation.

Note: If the subdirectory to which you want to install Wizard does not already exist in your root directory (for instance, BB), then you must create the first level of it in the root directory (for instance, type **md BB** and press Enter). SETUP will create all the other levels of the install path. (Miller Associates wiz02.doc)
